

AI-NATIVE ERP

The AI-Native Alternative to SAP — Built for Turkey First

A modular, AI-first ERP platform: compliance-ready for Turkey from day one, priced transparently, and built to compete with SAP, Logo, and the new wave of AI-native challengers.

SAP is unaffordable. Logo is affordable but dated.

SAP

Expensive & consultant-dependent

- ▶ Implementations: \$1.5M–\$4M mid-size; \$3M–\$20M+ enterprise
- ▶ SI/consultant fees = 40–60% of total project cost
- ▶ Consultant day rates: \$1,800–\$2,500
- ▶ Multi-year rollout cycles, even for “cloud” editions

Logo Yazılım

Cheaper, but shows its age

- ▶ Repeated complaints: outages, unresolved bugs, “every update breaks something”
- ▶ Opaque, reseller-quoted implementation pricing
- ▶ Dated UX; heavy web client
- ▶ Wins mainly on compliance reliability + incumbency, not product quality

AI is bolted on everywhere else. We build it in.

- ▶ **Retrofitted, not native.** SAP Joule, MS Copilot, and Oracle Fusion AI Agents are real and improving fast — but bolted onto schemas designed decades before LLMs existed.
- ▶ **A funded challenger wave exists...** Rillet, DualEntry, Campfire, Light, Everest have raised \$400M+ in 18 months rebuilding ERP AI-native from the ground up.
- ▶ **...but none touch Turkey.** None of them handle e-Devlet compliance. None offer full operational scope — manufacturing, inventory, HR — they are finance/close-only.
- ▶ **Turkey is structurally under-served.** 76%+ of 10–49-employee Turkish firms run no ERP at all today — a greenfield opportunity, not just a displacement fight.

76%

**of Turkish firms with 10–49 employees
run NO ERP today**

ERP penetration roughly doubles once firms cross into the 50–249 employee band (46.0%) — the smallest firms are the least served and the least fought-over.

Source: TÜİK 2025 enterprise ICT-usage survey

Legacy pricing scales with complexity, not value

Illustrative entry-level pricing (\$/user/month)

- ▶ **SAP:** \$1.5M–\$20M+ implementations; 3-yr TCO \$150K–\$600K mid-market alone
- ▶ **NetSuite:** 6–10 modules typical; each add-on \$499–5,000/month
- ▶ **Dynamics 365 BC:** Passed NetSuite in customer count in 2025 (50K+ customers)
- ▶ **Odoo:** Flat per-user pricing, all apps included — closest model to ours

\$400M+ raised in 18 months — and none serve Turkey

Company	Funding	The Bet
Rillet	\$95M+	AI-native GL; 4-week implementations vs. ~12mo legacy
DualEntry	\$100M+ / \$415M val.	Full financial suite rip-and-replace; "\$10-100M gap" target
Campfire	\$100M in 12 weeks	Proprietary "Large Accounting Model"; wins customers from NetSuite
Light	~\$43M	Rebuilt GL for speed; multi-entity, multi-country hypergrowth
Everest	\$140M seed	Founded by ex-SAP HANA architect — a bet directly against SAP

The gap: all are finance/close-focused, English-market only. None handle e-Fatura/e-Defter/e-İrsaliye or broader operational ERP (manufacturing, inventory, HR).

Logo Yazılım: incumbent, but vulnerable

Logo Yazılım — by the numbers

TRY 5.8B	FY2025 revenue (+9% real growth)
85,000+	customers cited (market leader by count)
TRY 3.19B	cloud-based revenue (majority of business)
2013	acquired Netsis, the #2 independent vendor

Documented, repeated criticisms

- ▶ Support/call-center unavailability during invoicing outages
- ▶ ~2 years of unresolved WMS/stock-count issues for some users
- ▶ “Every update breaks something,” worse after e-İrsaliye rollout
- ▶ High LEM (maintenance) fees “without value in return”
- ▶ Opaque, reseller-quoted implementation pricing

Non-negotiable table stakes — and our built moat

Requirement	What it requires
e-Fatura	Mandatory above TRY 3M revenue (TRY 500K e-commerce/real estate; no threshold for hotels)
e-Defter	Mandatory for anyone on e-Fatura keeping accrual-basis books
e-İrsaliye	Mandatory for e-Fatura filers with 2025 revenue $\geq$ TRY 10M
SGK / e-Bildirge	Mandatory monthly payroll submission for anyone with employees
KDV / e-Beyanname	GİB pushing toward direct software-to-government API integration

This requires a dedicated, permanently-staffed compliance team tracking GİB Tebliğ changes — not a one-time build. It's the largest moat protecting Logo today, and the largest cost we must own to make it ours instead.

Five product principles

01

AI is infrastructure

Not a feature. Every screen and record has an AI layer that can explain, query, and (with confirmation) act.

02

Modular by design

Core + independently-priced Packages sharing one data model and one AI layer.

03

Compliance is a capability

Country requirements are a pluggable Localization layer the core supports from day one.

04

Transparent pricing

Every tier and package has a public price — unlike SAP's negotiation or Logo's reseller quotes.

05

Fast time-to-value

Weeks, not years — AI accelerates migration and configuration itself.

Embedded by default — not an add-on package

Base AI chat is included in every tier, always on. Only the deep end — agentic, high-volume automation — is metered. If AI were optional, we'd just be another ERP with a chatbot upsell.

Included — every tier

- ▶ Conversational Q&A across owned modules
- ▶ Explanations of any record or workflow
- ▶ Guided report generation
- ▶ Basic anomaly flags

Metered — “AI Action credits”

- ▶ Agentic multi-step automation (auto-draft POs, reconciliation sweeps)
- ▶ Autonomous forecasting agents
- ▶ High-volume usage
- ▶ Custom workflow building

Enterprise-only

- ▶ Custom agent development tooling
- ▶ Per-customer fine-tuned semantic layer
- ▶ On-prem / VPC model isolation
- ▶ Dedicated support

How the assistant stays accurate, safe, and auditable

Semantic layer, never raw text-to-SQL

Enterprise accuracy collapses from 91%→21% without one — metrics are computed deterministically, LLM only narrates

Permission enforcement at the data layer

Never post-retrieval filtering — the root cause of real incidents like Microsoft 365 Copilot's EchoLeak (CVE-2025-32711)

Full AI audit trail by default

Prompt + context + tool calls + approvals, append-only — ready for EU AI Act enforcement (Aug 2026)

Read vs. write are separate trust domains

Questions are automatic; actions are explicit, schema-typed tools (MCP pattern) with business-rule validation

Human-in-the-loop for mutating actions

Durable “pending_approval” checkpoints above a configurable risk/dollar threshold

Golden-query library with feedback loop

User corrections continuously improve accuracy — a cheap, high-leverage mechanism

One Core. Independently-priced Packages.

CORE PLATFORM (included, not sold separately)

GL & Chart of Accounts · AR/AP · Users/Roles/Permissions · AI Chat Layer · Compliance Engine · Audit Trail · Base Reporting

**Purchasing /
Procurement**

**HR & Payroll
(Turkey-aware)**

Project Mgmt

POS / Retail

**E-commerce
Integration**

**Advanced BI /
Analytics**

**Advanced AI
Agents Pack**

Transparent tiers — no reseller quotes required

Starter

1–15 employees

\$15–25/user/mo

- ▶ Core + 1 package
- ▶ Base AI, no agentic actions

Growth

15–75 employees

\$35–50/user/mo

- ▶ Core + up to 4 packages
- ▶ Base AI + limited AI credits

Professional

75–250 employees

\$60–90/user/mo

- ▶ Core + unlimited packages
- ▶ Base AI + generous AI credits

Enterprise

250+ employees

Custom/user/mo

- ▶ Everything + custom
- ▶ Full agentic automation, on-prem option

Year-1 all-in cost, illustrative (~20-user deployment)

► **SAP:** \$150K–\$600K+ 3-yr TCO; SI fees alone = 40–60% of budget

► **Logo:** License looks cheap; implementation/customization billed separately by resellers, opaque

► **Us:** Transparent, all-in, predictable — scales with headcount, not negotiation leverage

Small end first in Turkey, then broaden

01

Enter small

Target the 76%+ of small Turkish firms with no ERP — lower CAC, lower switching anxiety

02

Win on compliance, then AI

Clear the e-Fatura/e-Defter trust bar first; differentiate on AI-native UX and pricing after

03

Lean partner channel

A thinner, more transparent reseller program than Logo's opaque İş Ortağı network

04

Expand internationally

Compete with Rillet/DualEntry on full operational scope once Turkey + compliance depth are proven

Phased delivery, compliance-first

Decisions we need to make together

- 1 Rip-and-replace full ERP vs. AI-copilot-on-Logo as the initial wedge?
- 2 Which package ships first after Core — Purchasing or Inventory?
- 3 Build a services/implementation arm, or stay pure-SaaS with partners?
- 4 Product/brand name — needed before domain & trademark search
- 5 Any design partners or LOIs already in motion to prioritize?
